

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

chickens. It was so tame he thought he could have easily killed it with a club. The bird was thin, and from the appearance of its digestive organs it had fasted a long time.—A. H. Wood, Painted Post, Steuben Co., N. Y.

Megascops asio floridanus in Louisiana.—While in New Orleans, in June, 1886, Mr. Gustave Kohn kindly gave me a number of birds and reptiles from his collection. Among them was a Florida Screech Owl (Megascops asio floridanus), several specimens of which he had secured in the vicinity of New Orleans. I believe this bird has not before been recorded from Louisiana.—A. K. FISHER, M. D., Washington, D. C.

Ceophlœus pileatus in Franklin County, Massachusetts.—During the month of August, 1886, two Pileated Woodpeckers were shot at Ashfield, Franklin Co., Mass.; and on October 7 of the same year a third, which I have, was shot. It is a male, but in not very good plumage, as it was moulting at the time it was shot.—RICHARD NORTON, Cambridge, Mass.

Breeding of the Prairie Horned Lark in Eastern New York—A Correction.—In the Bulletin of the Nuttall Ornithological Club, Vol. VI, p. 177, I noted the capture, in April, 1881, of two young Horned Larks, just able to fly, and two adults, male and female, at Green Island, N. Y., and called them, specifically, "Eremophila alpestris"—not knowing their proper race name.

Mr. William Brewster lately saw the mounted skins of these birds and informed me that they are of the variety *Otocoris alpestris praticola*, described and named, in 1884, by Mr. H. W. Henshaw, in 'The Auk,' Vol. I, pp. 254-268.

I have given very little attention to the Horned Larks of this vicinity, but know of specimens of the variety praticola taken within five miles of Troy, N. Y., February 22, 1883, and in March and October, 1887. A larger and darker colored variety, probably alpestris proper, visits this locality in winter; and I have a specimen of that race captured here about April 25, 1845.—Austin F. Park, Troy, N. Y.

The Prairie Horned Lark (Otocoris alpestris praticola) on the Coast of Massachusetts. — Looking over a large series of Horned Larks in my collection I lately found a pair of perfectly typical O. a. praticola labelled "Revere Beach, Massachusetts, February 28, 1883." Under this date my journal has the following entry: "I shot these birds [Nos. 7925, 7926] with another, a female similar to No. 7926, near the beach in a field where the ground was partly bare of snow. There were only three of them in all. The testes of the male were of large size but the ovaries of the females not correspondingly developed."

The female "similar to No. 7926" was badly shot, if I remember right, and not suspecting at the time (fully a year, it should be noted, before the appearance of Mr. Henshaw's admirable paper on the genus *Otocoris*) that it was anything more than a small dark specimen of *O. alpestris*, I doubt-
